(a) **Backbone Architecture:** Better backbones bring expected gains: deeper networks do better, FPN outperforms C4 features, and ResNeXt improves on ResNet.

	AP	AP <sub>50</sub>	AP <sub>75</sub>
<i>softmax</i>	24.8	44.1	25.1
<i>sigmoid</i>	<b>30.3</b>	<b>51.2</b>	<b>31.5</b>
	+5.5	+7.1	+6.4

(b) **Multinomial vs. Independent Masks** (ResNet-50-C4): *Decoupling* via per-class binary masks (sigmoid) gives large gains over multinomial masks (softmax).

(c) **RoIAlign** (ResNet-50-C4): Mask results with various RoI layers. Our RoIAlign layer improves AP by  $\sim 3$  points and AP<sub>75</sub> by  $\sim 5$  points. Using proper alignment is the only factor that contributes to the large gap between RoI layers.

(d) **RoIAlign** (ResNet-50-C5, *stride* 32): Mask-level and box-level AP using *large-stride* features. Misalignments are more severe than with stride-16 features (Table 2c), resulting in big accuracy gaps.

(e) **Mask Branch** (ResNet-50-FPN): Fully convolutional networks (FCN) vs. multi-layer perceptrons (MLP, fully-connected) for mask prediction. FCNs improve results as they take advantage of explicitly encoding spatial layout.

Table 2. **Ablations.** We train on `trainval35k`, test on `minival`, and report *mask* AP unless otherwise noted.
